

France Culture in partnership with Pour la Science magazine (French edition of Scientific American) invited Richard Taillet from the LAPTh Astrophysics and Cosmology Team and Professor at Université de Savoie to talk about Dark Matter Hunting in Underground Experiments. He reviewed the human challenges and the technological infrastructure that are put in place today in the search of the missing dark matter of the universe. Thanks to more and more precise instruments installed in old mines, physicists are searching for the elusive dark matter. With detector sensitivity increasing the noose is tightening around this hypothetical component of the Universe
