

The next session of the PhysTeV Workshop initiated by LAPTh physicists in 1999 and organized every two years since then, will take place in Les Houches as usual from 3-21 June 2013. This series of workshops has contributed much to the physics of the LHC by bringing together in an a relatively secluded place theorists and experimentalists working either towards a better precision for the standard model observables or on new models and theories for the New Physics. This has led, among other things, to the many celebrated Les Houches Accords and Les Houches Recommendations. 2013 will be the year where we will finally discuss the impact of the newly discovered resonance, which is probably the long sought after LH, ...oops Le Higgs.
